

Remarks on the Dysentery and Hepatitis of India

This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1846 edition. Excerpt: ...and its numerous and important glands, are generally more concerned than the liver. Mr. Annesley has some excellent remarks on this head. In speaking of hepatitis I shall return to this subject, and shall then discuss the supposed antagonism in point of excretion between the liver and lungs. If, as I have reason to believe, the doctrine of increased action of the liver be erroneous, the effects of heat are to diminish all the secretions except that of the skin. We can then easily conceive, that as the cutaneous excretion plays a more important part than in colder climates, so alterations in it are followed by graver consequences. Why these consequences should implicate the colon so particularly, is at present impossible to determine. Parnoroor or Drsrnvrrzar. The anatomical signs of dysentery are, enlargement and ulceration of the caecal and colonic solitary glands, consequent on acute inflammation of these glands; just as enlargement and ulceration of the iliac agminated and solitary glands are the anatomical marks of one form of typhus, as a peculiar change in the liver is the mark of yellow fever (Loins), or as certain alterations in the liver and spleen are the anatomical appearances of malignant remittent fever. But the pathology of a disease is a term which includes all the relations such a disease may have to other allied affections. The pathology of dysentery cannot be said to be known till we understand all the causes which produce its anatomical marks, the steps which changes so induced pass through, and all the phenomena they generate., It is at once apparent how much remains to be determined before this comprehensive pathology can be made out. The causes

must be understood, the alliance between the colon and liver, and skin,...
