During the past 239 years, our fighting forces have been stopped more often by diseases such as smallpox, cholera, and malaria than by enemy bullets. Our lessons learned in fighting these diseases have never been more important than they are today, because the health and resilience of our men and women in uniform have never been a greater matter of national security. Throughout history, the Army Medical Department has used our past experiences to strengthen our capacity and our resolve as a healthcare organization to support and sustain the Army, enhance the care experience, and innovate Army Medicine. Tuberculosis is one of the diseases that have incapacitated our fighting forces in the past. Good Tuberculosis Men: The Army Medical Departments Struggle With Tuberculosis details the history of the Armys battle with this disease. Carol R. Byerlys extensively researched and insightful publication highlights the adaptability, tenacity, and

resourcefulness of Army Medicine in overcoming challenging obstacles in the past. Early Army tuberculosis programs proved to be effective; tuberculosis dropped from first place among reasons for federal disability discharges after World War I to 13th place after World War II. By the 1960s, tuberculosis became a curable and controllable disease. The US Army Medical Departmentas with many infectious diseaseswas a leader in the global efforts to contain, control, and cure this disease. While the prevalence of tuberculosis has decreased dramatically in the Western world, it is still common in other parts of the world where nearly two million people die each year from tuberculosis, and one-third of the worlds population is infected. As a result, tuberculosis is a serious threat to our fighting capabilities should American fighting men and women deploy to areas where this disease is still endemic.
